

General range of flameproof electrical motors

Individual solutions are our standard

BARTEC VARNOST

The plant itself came into being in 1957 as one of the small working units of the Zagorje coal mine. Five years later, in 1962, it became a separate company called "TEVE VARNOST". Numerous organizational restructurations took place during the following years and in 1997 the company was taken over by BARTEC to become "BARTEC VARNOST".

BARTEC Motors and electrical equipment

BARTEC develops and manufactures electric motors and electrical equipment for safe and reliable solutions in power, lighting, control and monitoring applications.

Our production program includes:

- Electric motors
- Special motors and special solutions
- Switches and controllers
- Lighting systems

All products can be supplied for potentially explosive atmospheres, wet environments or tailored to our customers' requirements.

BARTEC VARNOST, Zagorje

Ignition temperature - temperature class

The ignition temperature is influenced by various factors such as size, shape, type and composition of a surface. In IEC 79-4, IEC, CENELEC and other standards the authorities have agreed on a "procedure for the determination of ignition temperature" with a limit approaching the lowest possible value.

The gases and vapours are classified into temperature classes. In accordance with these temperature classes, electrical equipment is tested for its maximum surface temperature to ensure that the possibility of ignition due to the surface temperature is excluded in normal and abnormal operation. The standards specify to which extent these standard values may be exceeded and determine the necessary safety margins.

| Temperature class | Ignition temperature range of mixture | Permissible surface temperature of electrical equipment | Permissible temperature rise |
|-------------------|---------------------------------------|---|------------------------------|
| T1 | > + 450 °C | + 450 °C | + 410 °C |
| T2 | > + 300... ≤ + 450 °C | + 300 °C | + 260 °C |
| T3 | > + 200... ≤ + 300 °C | + 200 °C | + 160 °C |
| T4 | > + 135... ≤ + 200 °C | + 135 °C | + 95 °C |
| T5 | > + 100... ≤ + 135 °C | + 100 °C | + 60 °C |
| T6 | > + 85... ≤ + 100 °C | + 85 °C | + 45 °C |

Examples of the categorisation of gases and vapours in temperature classes and explosion protection subgroups.

| | T1 | T2 | T3 | T4 | T5 | T6 |

| IIA | Methane | Propane | Petrol | Acetaldehyde | | |
| IIB | | Ethylene | Diethylether | | | |
| IIC | Hydrogen | Acetylene | | | | Carbon disulphide |

2

Maintenance of explosion protection

Maintenance of explosion protection during operation.

Electric machines must be protected against overheating due to overloads. The type of protection depends on the type of operation as well as the electric machine and its use.

Explosion-proof electric motors are usually certified for S1 type of operation, i. e. continuous operation. Other duties are allowed only if the temperature of the motor is controlled by reliable devices.

| Duty type | Type of protection |
|---|--|
| S1* | A Motor safety switch according to IEC 60034-1 (VDE 0165/9.83) B Motor safety switch and temperature sensors in windings as additional protection. C Only temperature sensors as major protection only allowed if motor is tested and certified and if all control devices (power supplies) used are certified. |
| S2/S3* | D Motor safety switch with switch-on time control and/or temperature sensors in windings as additional protection. E Temperature sensors in windings as major protection. Only allowed if motor is tested and certified and if all control devices (power supplies) used are certified. |
| S4, S5, S6, S7, S8* | F Temperature sensors in windings. Motor must be tested and only certified control devices may be used. |
| Power supply by means of frequency converters | G Thermal protection of motor by means of sensors in windings is allowed as the only (independent) protection if motor is tested at all power supply frequencies, maximum voltage and S1-S7 (S8) types of operation. H If motor protection and converter are tested and certified as a unit. |

* For explanation of duty cycles see chapter "duty cycles".

3

Introduction

Explosion-protected electric motors are used in industrial plants with a potentially explosive atmosphere containing inflammable fumes (vapours) or gases (i. e. chemical industry, oil refineries...) as well as in mines where methane is present.

These are the three-phase, asynchronous electric motors with short-circuit rotor, explosion protected according to the CENELEC EN 60079-0, EN 60079-1, EN 60079-7 (IEC 60079-0, IEC 60079-1) standards.

The enclosures of electric motors are designed to be "flameproof" according to EN 60079-0 (IEC 60079-1). The terminal boxes could also be in "flameproof" design or also in "increased safety" design according to EN 60079-7 (IEC 60079-7).

The following regulations and standards have been considered in designing, manufacturing and testing of electric motors:

| Standard | IEC international | EN-CENELEC Europe |
|---|-----------------------------|-------------------|
| Rotating electric machines - classification of insulation materials for electric machines | IEC 60034-1 | EN 60034-1 |
| Climatic protection (IP number) Protection against harmful contact and ingress of solids | IEC 60034-5 | EN 60034-5 |
| Cooling devices for electric machines | IEC 60034-6 | EN 60034-6 |
| Construction and mounting of electric rotating machines | IEC 60034-7 | EN 60034-7 |
| Marking of terminals and directions of rotating of electric machines | IEC 60034-8 | EN 60034-8 |
| Noise levels | IEC 60034-9 | EN 60034-9 |
| Starting performances of short-circuit motors at 50 Hz and voltages up to 660 V | IEC 60034-12 | EN 60034-12 |
| Limited vibration levels for electric machines | IEC 60034-14 | EN 60034-14 |
| Relation between terminal sizes and ratings of three-phase short-circuit surface-cooled electric motors | IEC 60072-1, DIN 42673/3 | |
| Relation between terminal sizes and ratings for arrangements: IM B5, IM B10, IM B14 | IEC 60072-2 | |

European Directives

| Description | Directive |
|--|---------------------|
| Directive for explosive atmospheres (ATEX) | 94/9/EC, 1999/92/EL |

| Electric devices operating in explosive atmospheres flameproof "d" | IEC 60079-1 | EN 60079-1 |
| Electric devices operating in explosive atmospheres Increased safety "e" | IEC 60079-7 | EN 60079-7 |

Construction

Electric motors are of totally enclosed, fancooled (blow-over) type. Cooling is provided by fans blowing external air over the ribbed outside surface (cooling system IC 411 according to IEC 60034-6 or EN 60 034-6). Electric motors up to 250 frame size are made of grey cast iron. Motors frame sizes of 280 and 315 are made of welded housing and the terminal boxes of grey cast iron.

Bearings

Bearing lubrication

The following table lists the bearings used in the different motors. The bearings last about 20.000 hours in 4, 6 and 8 pole motors if the loads do not exceed the values indicated in the tables on pages 12 and 13.

Only the latest and most innovative bearings of known producers have been used in our motors. On customer request we equip the motors with other bearings (depends on the respective construction!).

The rotors are standard constructions and fixed on the D-end (frame size 71 mm to 250 mm) and NDE-end (frame size 280 mm to 315 mm).

Bearing

| Frame size | Poles | DE bearing | NDE bearing | Bearing dishes |

Bearing lubrication

Motors are normally fitted with permanently greased bearings of Type 2Z. According to experience the filled in grease will be sufficient for several years.

Motors fitted with grease nipples

Motors from frame size 160 and above can be fitted with regreasable bearings. For motors with lubrication system we recommend not to exceed lubrication interval of two years in any case. Lubricate the motor when operational. If the motor is fitted with a lubrication plate, use values given, or use values given in the table below. These values are according to L1 – principle.

The effectivness of motor lubrication should be checked by measuring the surface temperature of bearing endshield during normal operating conditions. If the measured temperature is +80 °C or above, the relubrication intervals must be shortened. Relubrication interval should be halvened for every 15 K increase in bearing temperature. If this is not possible then use the lubricants suitable for high operation temperature conditions.

Ball Bearing: Lubrication intervals in duty hours

| Frame size | Amount of Grease | Speed of the motor [min ⁻¹] | | | | | |
|------------|------------------|---|------|-------|-------|-------|-------|
| | [g] | 3600 | 3000 | 1800 | 1500 | 1000 | 500 |
| 160 | 25 | 7000 | 9500 | 14000 | 17000 | 21000 | 24000 |
| 180 | 30 | 6000 | 8000 | 13500 | 16000 | 20000 | 23000 |
| 200 | 40 | 4000 | 6000 | 11000 | 13000 | 17000 | 21000 |
| 225 | 50 | 3000 | 5000 | 10000 | 12500 | 16500 | 20000 |
| 250 | 60 | 2500 | 4000 | 9000 | 11500 | 15000 | 18000 |
| 280 | 70 | 2000 | 3500 | 8000 | 10500 | 14000 | 17000 |
| 315 | 90 | 2000 | 3500 | 6500 | 8500 | 12500 | 16000 |

Roller Bearing: Lubrication intervals in duty hours

| Frame size | Amount of Grease | Speed of the motor [min ⁻¹] | | | | | |
|------------|------------------|---|------|------|------|------|------|
| | [g] | 3600 | 3000 | 1800 | 1500 | 1000 | 500 |
| 315 | 45 | 1000 | 1700 | 3000 | 4300 | 6000 | 8000 |

At an ambient temperature of ≤ 25 °C, twice the grease life can be expected, however, 33000 hours at a maximum.

In case of frequency converters and in continous operation at very low speeds, as well as at low temperature, the lubrication capabilities of standard greases may not be sufficient and special greases with additivies are needed.

If motors are equipped with sealed bearings (i. e. bearings greased for life) any deviation in the operating temperature from design temperature will result in a change in lifetime of bearings.

The use of conductive greases for elimination of bearing currents is not recommended due to their poor lubrication characteristics and low conductivity.

Regreasing or replacement of greas is only allowed with grease quality of the same kind (same saponification component or consistency).

Shaft ends

The standard electric motor is equipped with one free shaft extension. On request we also supply versions with free shaft extensions on both sides.

The dimensions of the shaft ends correspond to the IEC 60072 (1971) standard, fifth edition. Tolerances for shaft end-diameters are in accordance with DIN 7154:

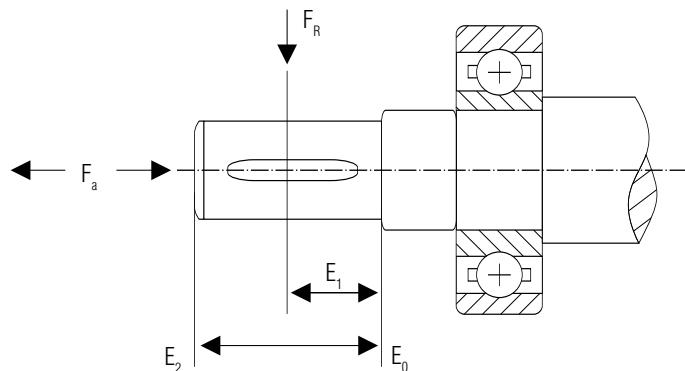

- up to diameter of 50 mm/ISO k6
- more than 50 mm/ISO m6

Free shaft extensions are equipped with keyways. Keyway and key correspond to DIN 6885.

The shafts have a threaded central hole for the drawing in, drawing out and fixing connections.

| Shaft diameter | 14 mm | 19 mm | 24 mm | 28 mm | 38 mm | from 42 to 48 mm | from 55 to 80 mm | from 90 to 100 mm |
|-----------------|-------|-------|-------|-------|-------|------------------|------------------|-------------------|
| Internal thread | M5 | M6 | M8 | M10 | M12 | M16 | M20 | M24 |

The load rating of bearings has been calculated for at least 20 000 operating hours at a frequency of 50 Hz. Only the axial loads have been considered. If the load is made up of axial and radial loads, the working life of the bearings is shorter.

| 110 < P ≤ 220 | 87 | 91 | 94 | 96 | 98 | 100 |

Vibrations

The noise level of electric motors is below the limits prescribed by the IEC 60034-9 recommendation for fan-cooled (blow-over) electric machines.

The rotors of electric motors are dynamically balanced with installed fan and 1/2 key. Vibration amplitude corresponds to grade A according to IEC 60034-14 (ISO 2373-N grade).

Limit values for the vibration of electric machines (IEC 60034-14)

| Vibration grade | Shaft height [mm] | 56 ≤ H ≤ 132 | 132 < H ≤ 280 | H > 280 |
|--------------------|-------------------|-----------------|---------------|---------|
| | Mounting | Velocity [mm/s] | | |
| A | Free suspension | 1.6 | 2.2 | 2.8 |
| | Rigid mounting | 1.3 | 1.8 | 2.3 |
| B | Free suspension | 0.7 | 1.1 | 1.8 |
| | Rigid mounting | - | 0.9 | 1.5 |

Grade "A" applies to machines with no special vibration requirements

Grade "B" applies to machines with special vibration requirements

Terminal box and terminals for supply cable

Terminal box

The terminal box is fitted to the top of the motor with the cable entering from the fan end of the motor. It can be repositioned in steps of 90° to 180° to suit the application.

The motors with direct starting are equipped with 3 connection terminals. 6 connection terminals are fitted to Star-Delta, two speed and dual voltage machines.

The electric motors with sizes 71 to 132 inclusive and Ex e terminal boxes have 6 additional connection terminals for PTC sensors, heaters etc. The motors with Ex d terminal boxes are also equipped with 6 connection terminals. Exception is the 71 motor with only 4 connection terminals.

Each terminal box has one connection terminal for the protective conductor.

Ex d terminal boxes include a threaded entry to accept Ex d cable glands (see table below). Ex d thread reducers or adaptors can be included as an option for other thread sizes and thread forms.

| Terminals for supply cable and cable entries | | | | |
|--|--|-----------------------------------|-------------------|---------------|
| Frame size | Terminals for a max. cross section of supply cable (mm²) | Cable entries for main connection | | |
| | | Ex e terminal box | Ex d terminal box | |
| 63 | 2.5 | 1 x M20 x 1.5 | 6 to 13 | 1 x M20 x 1.5 |
| 71 | 2.5 | 1 x M20 x 1.5 | 6.5 to 12 | 1 x M20 x 1.5 |
| 80 90 100 | 4 | 1 x M25 x 1.5 | 10 to 17 | 1 x M25 x 1.5 |
| 112 | 4 | 1 x M32 x 1.5 | 13 to 18 | 1 x M32 x 1.5 |
| 132 | 4 | 2 x M32 x 1.5 | 13 to 18 | 2 x M32 x 1.5 |
| 160 180 | 16 | 2 x M40 x 1.5 | 17 to 28 | 2 x M40 x 1.5 |
| 200 225 | 16 | 2 x M50 x 1.5 | 23 to 38 | 2 x M50 x 1.5 |
| 250 280 315 | 95 to 300 | 2 x M63 x 1.5 | 31 to 48 | 2 x M63 x 1.5 |

* Additional one cable entry (gland) M20 x 1.5 for PTC

Increased safety terminal boxes include Ex e cable glands in accordance with EN 60079-0, and EN 60079-7.

The empty entries are fitted with suitably certified stopping plugs. Additional entries can only be made in our factory under strict quality procedures.

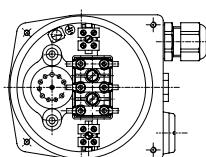

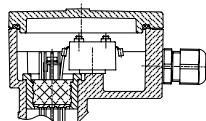

The Ex d terminal may receive additional threaded holes (NPT, ISO 7/1) by means of adapters.

One threaded hole M20 x 1.5 is provided on the Ex d terminal boxes for the thermal protection and for heaters. Ex e terminal boxes have an additional cable gland M20 x 1.5 for cable diameters of 6 to 12 mm.

Degrees of IP protection and coating

IP protection

IP protection of electric motors corresponds to IP 55. Motors with a higher degree of IP protection are manufactured on special request.

| Protection against environmental influences IP protection | |
|---|---|
| IP protection | Protection against harmful contact and ingress of solids (1st Numeral) |
| IP 44 | Protection against direct contact with electrically live and rotating inner parts using tools, wire or similar objects with a diameter exceeding 1 mm. Protection against ingress of solids (diameter > 1 mm). Fan air outlets and water exhausts may have a second-degree level of protection. |
| IP 54/IP 55/IP 56 | Complete protection against contact with electrically live and moving rotating inner parts. Protection against harmful ingress of dust. Ingress of dust is not fully prevented, but must not reach an extent causing harmful effects to machine operation. |
| IP 65* | Complete protection against contact with electrically live parts and rotating inner parts. Protection against ingress of dust (dust-proof machine). |
| IP protection | Protection against ingress of water (2nd Numeral) |
| IP 44/IP 54 | Water particles spraying from any direction do not have any harmful effects on the machine (i. e. rain). |
| IP 55/IP 65* | A jet of water spraying from any direction does not have any harmful effects on the machine. |
| IP 56 | During rough seas water must not penetrate into the interior of the motor to such an extent as to cause damage to the machine (deck-mounted motors). |

*All vertically-mounted electric motors with free shaft extension on the top must be protected against particles falling into the fan cover. This protection is not necessary if the machine itself has such a protection. Electric motors mounted outdoors must be protected against exposure to direct sunlight.

Coating

| Surface protection against environmental influences | | | |
|--|---|---|---|
| | Anti-corrosion protection 2 (standard) | Anti-corrosion protection 3 (special) | Special surface protection |

| Protection against corrosion in environments with water | high humidity, steam, sea water | high humidity, steam, sea water | |
| Environments resistance | periodic spilling or spraying of anorganic acids and lyes | periodic spilling or spraying of anorganic acids and lyes | |
| Suitable for | normal industrial atmospheres, relatively high humidity and high content of salt and aggressive gases (SO_2 , NO_x) | Chemically aggressive atmospheres, high content of salt and aggressive gases (SO_2 , NO_x). Condensation of moisture and electrolytes on surface. Solvents and oil derivatives have negative effects. | Products with surface protection for marine/offshore and tropical conditions are available on special request |

* Mining industry: yellow RAL 1003 for 500 V, grey RAL 9003 for 1000 V

Arrangements

The types of electric motors and their symbols are prescribed by the IEC 60034-7, EN 60034-7 standards. Motors are manufactured following the basic IM B3, IM B5 and IM B14 types.

Table 4 shows the symbols and mounting arrangements for the standard models manufactured by our company. IM B3 type motors can also operate in IM B6, IM B7 and IM B8 mounting positions.

| | | | | | |

Electrical data

Power, voltage and frequency

The power ratings given in the tables are valid for operation under uniform, continuous load (S-1 according to IEC 60034-1, EN 60034-1) at a rated voltage, a frequency of 50 Hz, temperatures of up to +40 °C and an altitude of less than 1 000 m above sea level. The data in the tables refer to 400 V, but motors have been designed for 380 V and 415 V.

Voltage or frequency variations of +/- 5 % are allowed; within these limits the power ratings remain unchanged and the maximum winding temperature is not exceeded.

Versions using 110 V to 1 000 V and frequencies of 50 or 60 Hz are available on special request. 50 Hz, 380 V, 400 V, 415 V electric motors may also be connected to 440 V to 480 V and a frequency of 60 Hz. Then the maximum load can be increased by 15 % and the number of revolutions by approximately 20 %.

If a 50 Hz, 380 V, 400 V, 415 V electric motor is connected to a 60 Hz line, its maximum load may not exceed the nominal power. The number of revolutions increases by 20 %, while the starting and maximum torque decreases by approx. 18 %.

Overload, efficiency and power factor

Electric motors heated to the operating temperature limit resist to a 2-minute overload of 1.5 In without being damaged. Variations between the 5/4 and 3/4 of the rated load have no essential influence on efficiency and power factor.

| Efficiency η (%) of the rate load | | | | Power factor cos φ of the rate load | | | |
|--|-----|------|------|--|------|------|------|
| 5/4 | 4/4 | 3/4 | 2/4 | 5/4 | 4/4 | 3/4 | 2/4 |
| 96 | 96 | 96 | 94.5 | 0.94 | 0.94 | 0.92 | 0.74 |
| 95 | 95 | 95 | 93.3 | 0.94 | 0.93 | 0.92 | 0.68 |

Windings

Materials of thermal class F are used for the production of stator windings. They are designed to withstand an overtemperature of 80 K at a maximum ambient temperature of +40 °C. Electric motors operating under heavy conditions, conditions requiring frequent start-ups or ambient temperatures above +40 °C employ special insulation (thermal class H) and are available on special request. Windings of electric motors rated up to 3 kW are connected via star, while those of high-rated motors employ delta connection. Two-speed motors with 2:1 speed ratio use Dahlander windings. Electric motors with a pole relation of 4/6 or 8/6 have two separate stator windings in star connection.

| Wiring diagram | Ex d | Ex e | Ex d and Ex e terminal box | Ex d | Ex e |
|--|------|------|----------------------------|--|------|
| Single speed Start with Y-D switch, remove Y-D jumper | | | | | |
| Y-D-jumper in Y-connection for direct coupling | | | | Y-D-jumper in D-connection for direct coupling | |
| Pole-changing | | | | | |

| Low speed | | | | High speed | |
| Pole-changing (Dahlander) | | | | | |
| Low speed | | | | High speed | |

Installation instructions

for the mains connection and start-up of motors with Ex d terminal box.

Connect the motors via suitable cable and line entries that correspond to the EN 60079 directives, paragraphs 12.1 and 12.2 and have a separate test certificate. Unused openings must be closed as prescribed by EN 60079, paragraph 12.5. Cable and line entries (heavy-gauge conduit threads) and sealing plugs that do not meet these requirements must not be used.

Test and tolerance band of the rated values

Electric motors are tested in accordance with IEC 60034-2, EN 60034-2 regulations. All nominal and start-up value deviations are within the limits prescribed by IEC 60034-1, EN 60034-1.

The explosion-proof enclosure is tested according to the IEC 60034-1, EN 60034-1 regulations. All enclosure parts are tested with a water pressure of 1 000 kPa.

Rated values under extreme working conditions

When electric motors are used at temperatures above +40 °C or at altitudes of more than 1 000 m, the permitted overtemperature for windings is lower; the rated power is reduced respectively. The relation between rated power and ambient temperature altitude is shown in the diagrams.

Tolerances of rated values

The rated values shown in the tables may vary according to IEC 60034-1, EN 60034-1.

Performance

| | |

| Maximum torque | - 10 % of rated value |
|----------------|-----------------------|

| | |
|------------------|-----------------------------------|
| Starting current | + 20 % lower limit not prescribed |
|------------------|-----------------------------------|

Power reduction as temperatures rise

Power reduction at less cooling

Start-up characteristics

Start-up torque and current are the actual values the motor develops and the current values that cross the power supply cable when voltage is applied to the electric motor. The charts below show the values for both start-up torque and peak torque as well as the start-up current given as multiple of the nominal values.

Motor torque classification

For the right choice of the motor you not only have to know starting and maximum torque but also the torque curve and speed. To avoid the plotting of torque curves which are unique for each type of motor, the rotor torque class is defined as one of the electric motor's characteristics. This way the suitable motor can be chosen without the (exact) knowledge of the course of the torque curve.

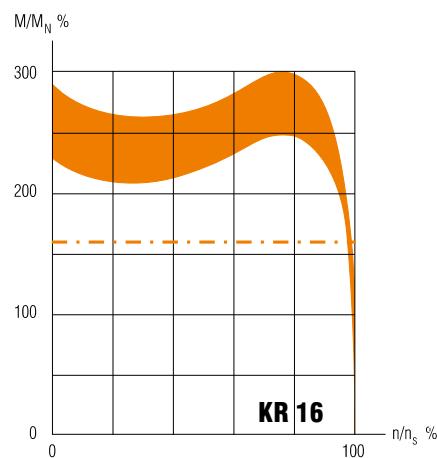

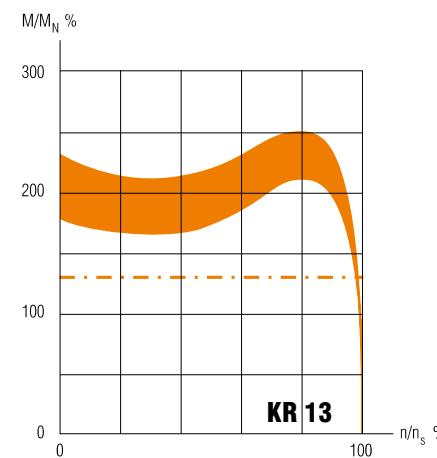

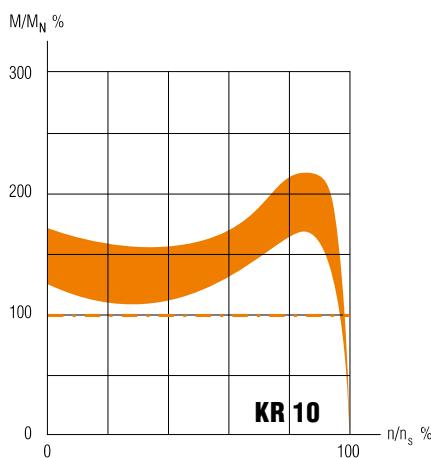

The motor torque class shows the maximum counter-torque for starting the motor. The starting torque class is specified according to the nominal voltage. In this catalog we distinguish three classes:

KR 10

KR 13

KR 16

The titles of the torque classes contain numbers which correspond to one tenth (1/10) of the maximum counter-torque value necessary to start up the motor. The following illustrations represent the torque curves of the classes KR 10, KR 13 and KR 16.

Duty cycles

S1 Continuous duty

Operation under constant load, lasting long enough to allow the machine to reach thermal equilibrium.

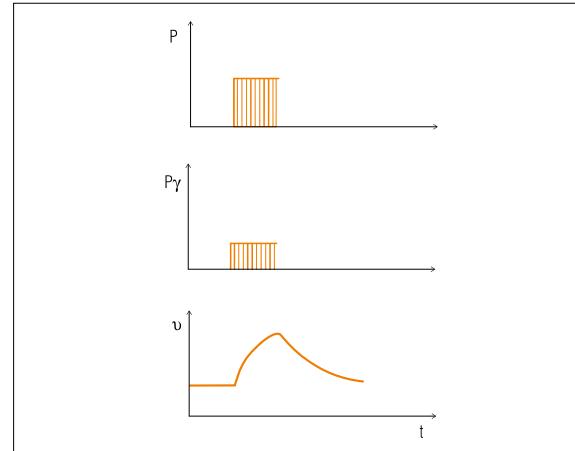

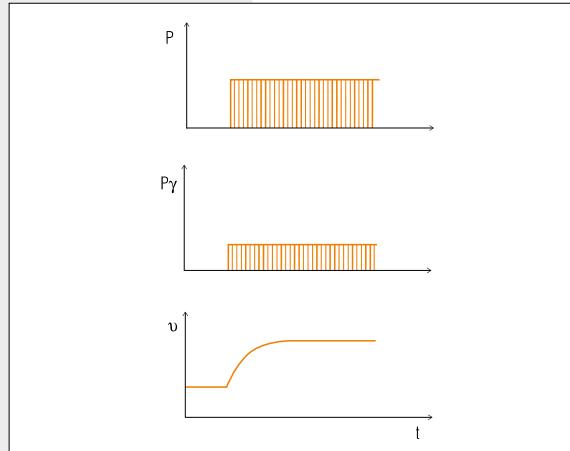

Designation: **S1**

S2 Short-time duty

Operation under constant load, for a time **too short** to allow the machine to reach thermal equilibrium. Idle time of the machine is long enough to allow the machine to cool down to ambient temperature.

Standard duration of short-term operation:
10, 30, 60 and 90 minutes.

Designation: **S2** 30 minutes.

S3 Intermittent periodic duty

Operation under repeated, constant load in specified cycles. Neither operating nor resting period are long enough to allow the motor to reach thermal equilibrium. The starting losses are small and do not essentially influence the temperature rise. The nominal values of relative starting time are 15, 25, 40, 60 % at a daily 10-minute cycle.

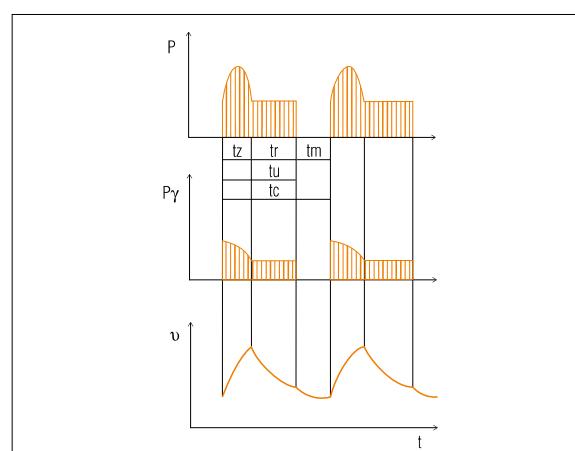

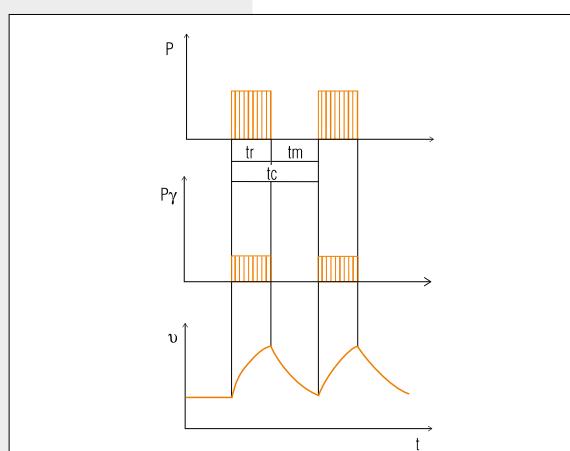

Designation: **S3** 25 %

S4 Intermittent periodic duty

Operation under repeated, constant load in specified cycles. The start of the motor influences the temperature rise.

In order to define this type of operation, the number of cycles (starts per hour) and inertia constant must also be known.

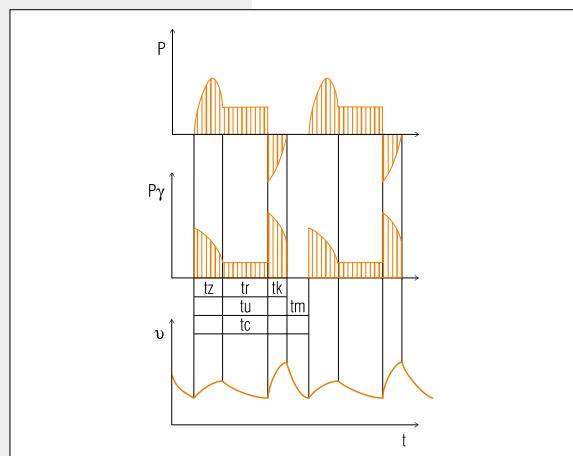

Designation: **S4** 40 %; 120 starts/h; Fl2

**S5 Intermittent periodic duty**

Same as S4 operation, except that the electric braking of the machine has an essential influence on the temperature rise.

Designation: **S5** 160 %; 120 starts/h; Fl2

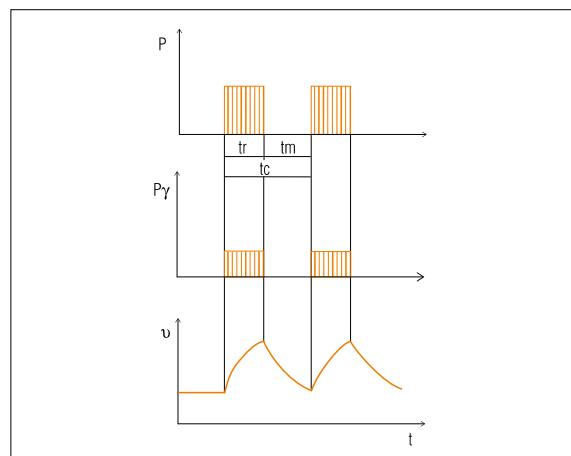

**S6 Continuous operation with cyclic load**

Operation consisting of a continuous series of equal cycles. Each cycle is made up of a no-load and a constant load period.

The cycle duration is not long enough to allow the machine to reach thermal equilibrium in one cycle.

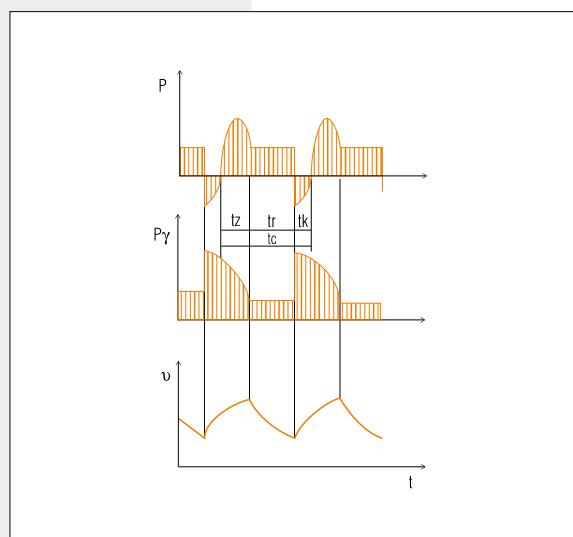

In order to define S6 operation, the relative starting time must be specified.

Designation: **S6** 15 %

**S7 Intermittent periodic duty with starting and braking**

Uninterrupted operation with a series of constant loading and braking periods. The most demanding type of operation for the motor. In order to define this type of operation, the number of cycles per hour and the inertia constant must be specified.

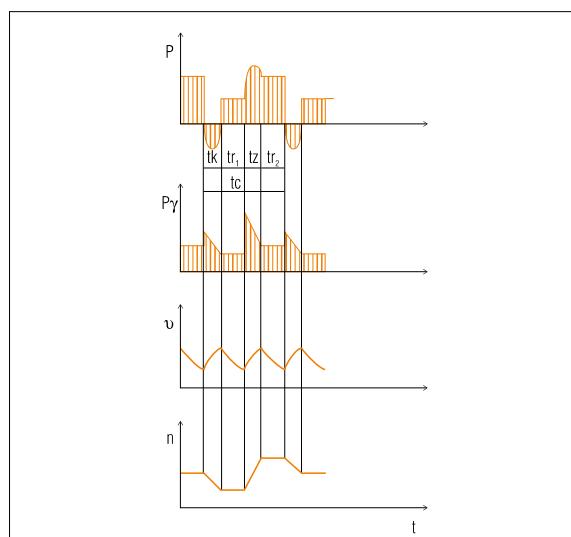

Designation: **S7** 500 starts/h; Fl3

**S8 Intermittent periodic duty with pole changing**

This type of operation only exists with pole amplitude modulated motors. In this case the definition of operation must contain the following data for each pole:

- number of starts per hour
- inertia constant
- relative operating period

Designation: **S8** 30 starts/h; Fl10; 740 min⁻¹; 40 %
S8 30 starts/h; Fl10; 960 min⁻¹; 60 %

**S9 Continuous operation with non-periodic load and speed variation** (e. g. converter operation)

Three-phase electric motors driven by frequency inverters

General description

The asynchronous motor with its short-circuit rotor and robust construction offers an excellent price-performance ratio. AC motors are designed for constant speed operation. It is not possible to change speed when they are running on fixed frequency supplies. There are drives which require the additional flexibility of smooth speed variations and this is best achieved with the use of an inverter.

Frequency inverters provide an excellent speed and the speed can be varied continuously over the entire frequency range. To avoid overheating, three PTC elements are built into the head of the winding. As the speed rises (higher frequency), the motor becomes louder. Voltage type frequency inverters cause a noise increase of about 7 to 15 dB, current type ones of about 3 dB.

We strongly recommend that you indicate frequency range and working characteristics of the motor ($T = f(n)$ or $P = f(n)$) when placing your order.

Power and torque characteristics of motors driven by frequency inverters

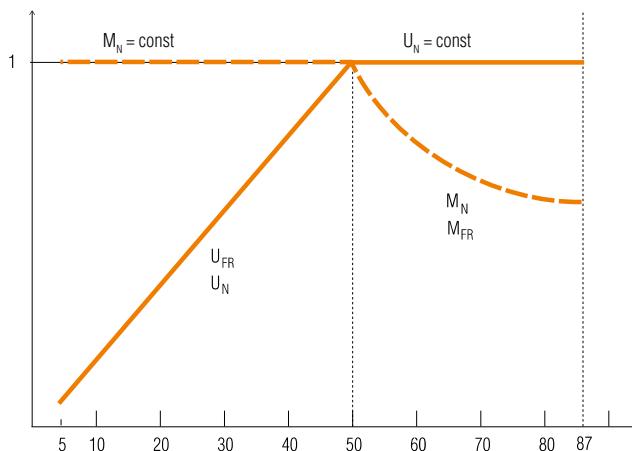

We distinguish two ranges:

■ 0 to 50 Hz range

Here the motor develops its normal torque on the shaft at 5 to 10 Hz of the output frequency (10 to 20 % of the nominal speed). The motor maintains the nominal torque at the shaft until the frequency reaches 50 Hz (100 % of the nominal speed). Voltage keeps rising while the magnetic flux is kept constant. The power increase in this range is linear to the revolutions ($P = k \times M \times n$).

■ 50 to 87 Hz range

Here the torque falls parallel to the speed. The voltage of the motor is maintained on a constant level while the magnetic flux is weaker. The current level is maintained and independent of the speed.

U_N = net voltage

U_{FR} = voltage of frequency inverter

M_N = motor torque on net

M_{FR} = motor torque on frequency inverter

Mounting dimensions

The mounting dimensions allow the following tolerances:

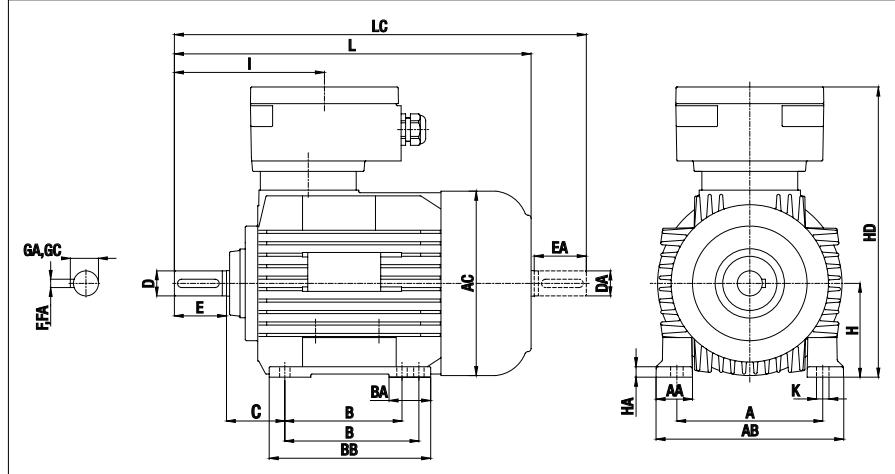

| Dimensions | Tolerance |
|----------------------------------|--|
| A, B | $\pm 0.75 \text{ mm}$ $\pm 1.00 \text{ mm}$ $\pm 1.50 \text{ mm}$ |
| H | - 0.50 mm - 1.00 mm |
| C | $\pm 1.00 \text{ mm}$ $\pm 2.00 \text{ mm}$ $\pm 3.00 \text{ mm}$ $\pm 4.00 \text{ mm}$ |
| M | $\pm 0.25 \text{ mm}$ $\pm 0.50 \text{ mm}$ $\pm 1.00 \text{ mm}$ |
| K and S + 3 % diameter | |
| E | - 0.20 mm - 0.30 mm |
| D | k 6 m 6 |
| N | j 6 h 6 |

Ordering data

- Rating in kW
- Voltage and frequency
- Start connection (on-line or star-delta)
- RPM
- Type of motor arrangement
- Type of explosion protection (Gas group and T-classification)
- Mechanical requirements
- Special requirements (i. e. H-class thermal insulation, two-shaft, radial bearing seals).

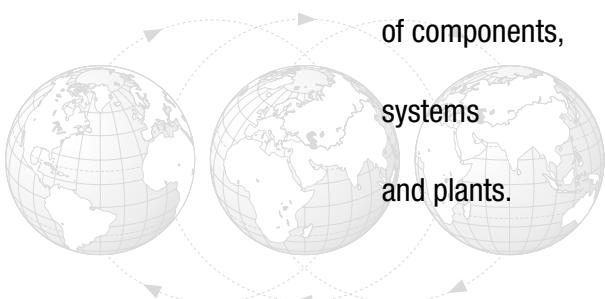

**Automation Technology****Enterprise Mobility****Control and Connection Equipment****Communication and Safety Systems****Switchgear and Motors****Analyzers and Measurement Technology****Measurement and Data Acquisition Systems****Heating Technology****Electrical Engineering for Mining****BARTEC Safe.t® Engineering and Service****BARTEC Safe.t® Academy****ATEX**
certified**Committed to safety**

Safety technology is indispensable to life in all areas where hazardous substances such as oil, gas or dust are handled. One spark is sufficient to ignite an explosive mixture. All component and system solutions developed by BARTEC meet the requirements specified in the European directives (ATEX) as well as in international standards and recommendations.

Throughout the world, people know and trust in the name BARTEC. The confidence of our customers commits us to meeting the highest quality standards. We are proud of many long-time partnerships with our customers.

BARTEC protects
people and
the environment
by the safety

of components,
systems
and plants.
